

— WEBSITE PROPOSAL

A website that turns searches into *appointments*

A new site for Columbia Animal Hospital, built around one job: when someone in Columbia or Foxworth needs a veterinarian — usually on a phone, often in a hurry — they find you, they trust you, and they call.

Built and ready to launch

PREPARED FOR

Columbia Animal Hospital

THE PRACTICE

1409 Hwy 98E

Columbia, MS 39429 · (601) 736-3041

SCOPE

19 pages

Nine of them service pages

CARING FOR PETS SINCE

1975

Small-animal exclusive since 2005

THE PROPOSAL

Half a century of practice, and a website that has fallen behind it

Columbia Animal Hospital has looked after the dogs and cats of Columbia and Foxworth since 1975, and has been a small-animal practice exclusively since 2005. Three veterinarians — Dr. Janelle Loper, Dr. Pat Sanford and Dr. Bridgett Williams — are published on your current site, all three of them Mississippi State graduates.

What follows is a proposal for one thing: a new website, already built, that represents the practice the way the practice actually is. Nineteen pages, designed for a phone first, written entirely from your own published words, and built so that search engines can read your address, your hours and your services without having to guess at them.

It is finished. You can open it, read every page and decide. The rest of this document explains what is holding the current site back, what has been built instead, and the three questions I need answered before it can replace the old one.

Nothing on this site was invented.

Every fact on the new pages — the hours, the address, what each service involves, what the doctors studied and when — traces back to something the practice already publishes. Where a source could not be confirmed, the claim was left off rather than guessed at. That record is written down and handed over with the site.

THE FIRST SCREEN

Four questions, answered before they scroll

Someone looking for a vet is deciding in seconds, usually one-handed. The top of the new home page answers all four of their questions without a scroll.

Is this the right one? At least six unrelated practices share the name Columbia Animal Hospital, in other states. Columbia, Mississippi is in the headline, and 1409 Hwy 98E sits on every screen.	Are they open? Mon–Fri 7:30 AM – 5:30 PM, Sat 8:00 AM – 12:00 PM, closed Sunday — on every page, with an indicator that says whether you are open right now.	Do they treat my animal? A full-service companion animal hospital. Nine services, each with its own page, so boarding, dental and grooming are not buried in a menu.
--	--	--

What do I do now?

Call (601) 736-3041, or
Request an Appointment. On
a phone both sit in a fixed bar
that stays on screen the
whole way down.

TODAY

What the current site is up against

None of this is neglect. It is what a site built on a hosted veterinary CMS looks like after a decade of the web moving on around it. Every item below is fixable, and most of them are quick — which is exactly why they are worth listing.

PLATFORM

A desktop-era build

The site is a classic ASP.NET WebForms application — every page ends in *.aspx*, served from a template shared with other practices on the same system. It works. It was designed for a browser on a desk.

PHONES

No mobile-first layout

The pages were not laid out for a phone, and most people looking for a veterinarian are on one. Pinching and dragging sideways to read your hours is friction at the worst possible moment.

DUPLICATION

The whole site exists twice

Every page is also reachable at *columbiaanimalhospital.vetsourcecms.com*. Search engines see two copies of one practice and split the credit between them instead of giving it all to your own domain.

SECURITY

Indexed on http as well as https

The boarding page and Dr. Williams' page are indexed over plain http. Browsers flag an http page as "Not secure", and http and https count as two different addresses — a third copy of the same content.

LISTINGS

Two directories have the address wrong

The Marion County Development Partnership lists **1498** Hwy 98 East. US Companies lists **Old** Hwy 98 E. Neither is your address, and local search ranking rests on your address reading the same way everywhere it appears.

HOURS

Two aggregators open you at 7:30 on Saturday

Your own site, your Facebook page and three directories say 8:00 AM. Pawlicy and GeniusVets say 7:30 AM. Someone who drives over at 7:30 and finds a locked door does not come back a second time.

SEARCH

Nothing is machine-readable

There is no structured data on the current pages. Nothing states, in the format search engines actually read, that this is a veterinary practice at this address, with these hours, serving Columbia and Foxworth. It all has to be inferred.

CONTENT

The after-hours gap

The site says an on-call veterinarian is available after hours — but nowhere does it say how to reach one. No second number, no answering service, no instruction. That is the most valuable missing sentence on the entire site.

- There are loose ends in the listings too: two Yelp pages for one business, a separate Yelp listing under a doctor's name at the same address, and an unclaimed Facebook place page sitting alongside your real one. Merging those is an afternoon's work and it is written up in the launch checklist that comes with the site.

THE BUILD

What has been built

Nineteen pages of plain, fast HTML. No page builder, no framework, no monthly platform license — one stylesheet and one small script, which any web developer can pick up and maintain.

THE SITE

[Home](#)[About](#)[Services](#)[Our Team](#)[New Patients](#)[Resources](#)[Contact](#)

[Request an Appointment](#)[FAQ](#)[A custom 404](#)

A PAGE FOR EACH SERVICE

[Surgery](#)[Dental Care](#)[Digital Radiography](#)[Heartworm Testing](#)[Dermatology](#)

[Reproductive Services](#)[Grooming](#)[Boarding](#)[Microchipping](#)

How it looks

White-led and editorial, with near-black sections for weight and two warm accents — an amber and a soft eucalyptus green — so the pages read warm rather than clinical. An editorial serif for headings, a clean sans for everything else. Every color pair was measured for contrast before it was used. This document you are reading uses the same palette and the same proportions, so you can see the tone of it before you open a single page.

How the home page is ordered

01	They land	The headline confirms they are in the right place: Columbia, Mississippi, companion animals, since 1975.
02	They understand the practice	In Columbia since 1975, small-animal exclusive since 2005 — established, not a chain.
03	They browse the services	All nine, each linking to its own page rather than a paragraph on a shared one.
04	They meet the doctors	Dr. Loper, Dr. Sanford and Dr. Williams, with where and when they qualified.

05	They know what a first visit involves	The New Patients page removes the reason people put off calling a new vet.
06	They know what happens in an emergency	An on-call veterinarian after hours, and a plain statement that this is not a 24-hour emergency hospital.
07	They act	Request an Appointment and the phone number are reachable from the header, the hero, the footer, every service page, and a fixed bar on mobile.

What it does that the current site does not

- ✓ **Structured data on every page.** LocalBusiness and VeterinaryCare markup carrying your opening hours and the area you serve, a Service entry on each of the nine service pages, FAQPage markup on the questions, and BreadcrumbList so search results show where a page sits.
- ✓ **One source of truth for your details.** The address, phone number and hours are stored once and written into all nineteen pages by the build. Local ranking depends on them matching character for character, and hand-editing nineteen pages is how they drift.
- ✓ **Self-hosted fonts.** Both typefaces are served from your own site, subset and preloaded. No third-party connection sits on the critical path, and the pages still look right if a font service is blocked or slow.
- ✓ **Tap targets that meet WCAG 2.5.8.** Buttons and links are big enough to hit with a thumb, verified at phone width rather than assumed.
- ✓ **It works with JavaScript disabled.** The FAQ uses native browser behavior, the navigation falls back to plain links, and no section can render blank. That is enforced, not hoped for.
- ✓ **No sideways scrolling anywhere.** Verified at 390px, 820px and 1440px — phone, tablet and desktop.
- ✓ **Accessible by construction.** Skip link, landmark regions, one heading structure per page in the right order, visible focus outlines, alt text on every image, and reduced-motion support.
- ✓ **A validator that runs the whole site.** One command checks structured data, that the FAQ markup matches the visible questions, missing files, tag balance, alt text, heading order, broken links, title and description lengths, and address and phone consistency across all nineteen pages. It renders every page in a real browser to check sideways overflow, that every image decodes, tap-target sizes, and that nothing disappears with JavaScript off. It fails loudly instead of quietly.
- ✓ **A one-command photo pipeline.** Every image slot is built at its real dimensions. Drop your photographs in a folder, run one command, and they are cropped, resized and wired into the right places.

- ✓ **A single-file preview you can share.** The entire site — every page, both fonts, every image — bundled into one file that opens by double-clicking. Email it, open it on your phone, show it to the staff. It is labeled as a preview so a forwarded copy is never mistaken for the live site.

→ **Two things were deliberately left out.** There are no testimonials, because I did not write any — the reviews section carries the practice's own mission statement and a link to your Facebook page, where real clients already leave real reviews. And your Facebook rating is not marked up as a review on the site, because it belongs to Facebook, not to you. Both are easy to add properly once you have first-party reviews with permission to use them.

THE POINT OF IT

Why this brings more people through the door

No one can promise you a position in search results, and I am not going to. What can be controlled is whether the details are right, consistent, readable by machines, and fast on a phone — and every one of those is currently working against you.

- ✓ **The map pack is where local vet searches get settled.** Those three results above everything else are driven by your Google Business Profile and by whether your name, address and phone match everywhere they appear. The new site states them identically on all nineteen pages, so the profile finally has something consistent to agree with.
- ✓ **Two directories with the wrong address, and two with the wrong Saturday opening time, are costing you visits.** Sending someone to 1498 instead of 1409, or to a locked door at 7:30 on a Saturday morning, is a lost client and a poor first impression of a practice that has been here since 1975. Correcting them is on the checklist.
- ✓ **Nine service pages give nine things to be found for.** Someone searching for pet boarding, a dental cleaning or heartworm testing in Columbia lands on a page about exactly that, instead of a general page they have to hunt through.
- ✓ **Your answers can appear in the results themselves.** The FAQ is marked up so search engines can lift an answer straight onto the results page — when to spay, when puppies need their shots, why dental care matters — with your practice's name on it.
- ✓ **Tap to call, from anywhere on any page.** A worried owner with a sick animal does not fill in a form. They call. The number is a single tap from the header, the hero, the footer, every service page and the fixed mobile bar.

- ✓ **One clear appointment path.** Request an Appointment is reachable from everywhere and lands on a page that explains how booking actually works at this practice, with the phone number front and center. There is no form pretending to send somewhere it does not.
- ✓ **Fixing the duplicates consolidates what you have already earned.** Redirecting the CMS subdomain, forcing https, and pointing each old .aspx address at its new page carries the ranking the current site has built up over the years across to the new one instead of throwing it away. The full redirect map is written and ready.
- ✓ **It is fast on a rural signal.** Plain HTML, no page builder, no framework — it loads instead of spinning, which matters more in Marion County than it does in a city.

Written for the way people actually search:

veterinarian Columbia MS

vet near me Columbia Mississippi

animal hospital Columbia MS

pet boarding Columbia MS

dog dental cleaning Columbia MS

heartworm testing Marion County

pet grooming Columbia MS

vet open Saturday Columbia MS

The biggest single win is not on the website.

It is the Google Business Profile. For the map pack it matters more than the site does: claim it, make the address match the site character for character, set the hours, add real photos. The new site is built to match it exactly, and getting that alignment right is part of this work.

INCLUDED

What you get

All of this is built and working today.

ITEM	DETAIL
------	--------

ITEM	DETAIL
The website	Nineteen pages: home, about, services, our team, new patients, resources, contact, request an appointment, a full FAQ, a custom 404, and a page for each of the nine services
Mobile design	Designed at phone width first, with a sticky header and a fixed call and appointment bar on mobile
Local search	LocalBusiness/VeterinaryCare, Service, FAQPage and BreadcrumbList structured data, sitemap, search-engine directives, and Google Business Profile guidance
Migration plan	A redirect for every existing <code>.aspx</code> page, so the ranking the current site has carries over
Brand assets	A paw mark drawn in the practice's green, plus favicons, a phone home-screen icon and a social share card generated from it — replaceable with real artwork if it exists
Photo system	Every image slot built at its real dimensions, with a one-command import for your photographs and a shot list telling you what to take
Shareable preview	The whole site in a single file you can email or open on a phone, with no server and nothing to install
Validator	One command that checks all nineteen pages, renders each one in a real browser, and fails if anything is wrong
Documentation	Launch checklist, photo checklist, brand and color notes, and a sourced record of every fact on the site and every claim deliberately left off it
Ownership	Every source file is yours, on any host you like

No monthly platform fee

The site is plain HTML. There is no page-builder subscription, no CMS license and no platform that raises its price every year. It runs on inexpensive hosting and keeps working untouched. Changing an opening time is a one-line edit in one file, and the build puts it on all nineteen pages — so you are not dependent on anyone to correct a number.

FROM YOU

What I need before it can launch

Two of these are genuine blockers — the new site should not replace the old one until they are answered — and neither takes more than a conversation. The third is photography.

1. How someone actually reaches the on-call vet

The practice publishes that an on-call veterinarian is available after hours, but never says how to reach one. The new site tells people to call (601) 736-3041, the only number you publish, and warns them not to drive over assuming someone is there.

I need to know what actually happens when that number rings at nine o'clock on a Sunday night, so the site can say exactly that. It is the single most useful improvement available to this website, and it is a sentence long.

2. Confirm Saturday's opening time

Your site, your Facebook page and three directories say 8:00 AM. Pawlicy and GeniusVets say 7:30 AM. The new site uses 8:00 AM.

Confirm which is right, and I will correct whichever listings are wrong as part of the launch.

3. Photographs of the practice

Every image on the site is currently a labeled placeholder at the right dimensions. Licensed stock photography is fine for the general care and service pictures, and I can handle that. Two images cannot be stock: the About page and the Contact page both show *your* building, and a photo of some other clinic presented as yours misrepresents the business.

A phone photo of the front of the hospital on a decent day is enough to start. Photographs of the team, the surgical suite and the boarding area would all earn their place — real pictures of a real practice beat stock every time, and people can tell the difference.

- **Two smaller things.** The site needs pointing at your domain, which is one command and updates every link, sitemap entry and share preview at once. And if a real logo file exists anywhere — a sign painter's artwork, an old print file — send it and it replaces the mark I drew.

WHAT IT COSTS

One price, and the site is yours

One price, paid once, and the site is yours. Not a subscription, and not a platform you rent and lose access to the day you stop paying — after fifty years in one building, owning the thing outright is the version that fits. Looking after it afterwards is priced separately so you can take it or leave it.

THE WEBSITE

\$3,500 once
and it is yours

Half on signature, half the day it goes live. Nineteen pages, the migration and the listing corrections, with nothing owed afterwards. The files are plain HTML, so the site runs on any host anywhere and you are never locked to me — or to anyone — to keep it online.

LOOKING AFTER IT — OPTIONAL

\$75 a month
or nothing at all

Hosting, backups, security updates, uptime monitoring, and the changes a practice actually needs: hours, a new doctor, a service added, a photograph swapped. Cancel any month. Decline it entirely and hand the files to whoever you like — the site is yours either way.

LIVE BY

Two to three weeks

from the day you say go

The site is built. Most of that window is waiting on the answers above and a photograph of the building — not on me.

INCLUDED EITHER WAY

The whole move

nothing extra at launch

Every old address redirected to its new page so nothing you have built up in search is lost, the domain pointed, the structured data and sitemap submitted, and the wrong listings corrected.

- **Photography is not in either number.** Sixteen slots on the site are still waiting on real pictures — your building, your rooms, your team at work. A local photographer for half a day will cover it, or a good phone and a bright morning will get most of the way there. I would rather tell you that than quietly bill you for stock photographs of somebody else's practice.

WHO BUILT THIS

Where to reach me

Call or email with a yes, a no, or a question. If something in here is wrong about the practice, that is worth a call on its own — I would rather correct it than have it sit on a website with your name at the top of it.

Next step

Open the preview on your phone. That is how most of the people deciding where to take their dog are going to see it, and it is the fairest test of whether this represents the practice properly.

If it does, answer the two questions — the after-hours number and Saturday's opening time — and we can set a launch date. The old pages get redirected to the new ones so nothing you have built up is lost, and the wrong listings get corrected at the same time.

If something is wrong, tell me what. It is written from your own published words, and you are the only people who can confirm which of those words are still true.

— Ryan Bullock

Prepared for Columbia Animal Hospital · 1409 Hwy 98E, Columbia, MS 39429 · (601) 736-3041. This is a proposal for a website that is built and ready to launch; it is not the live Columbia Animal Hospital site. Every fact quoted here about the practice comes from the practice's own published sources, and the full record of those sources — including the claims deliberately left off the site — is handed over with the project.
